About

What does the app do?

A react-native-based application for performing the timestamping or hour input operation.

What's extra

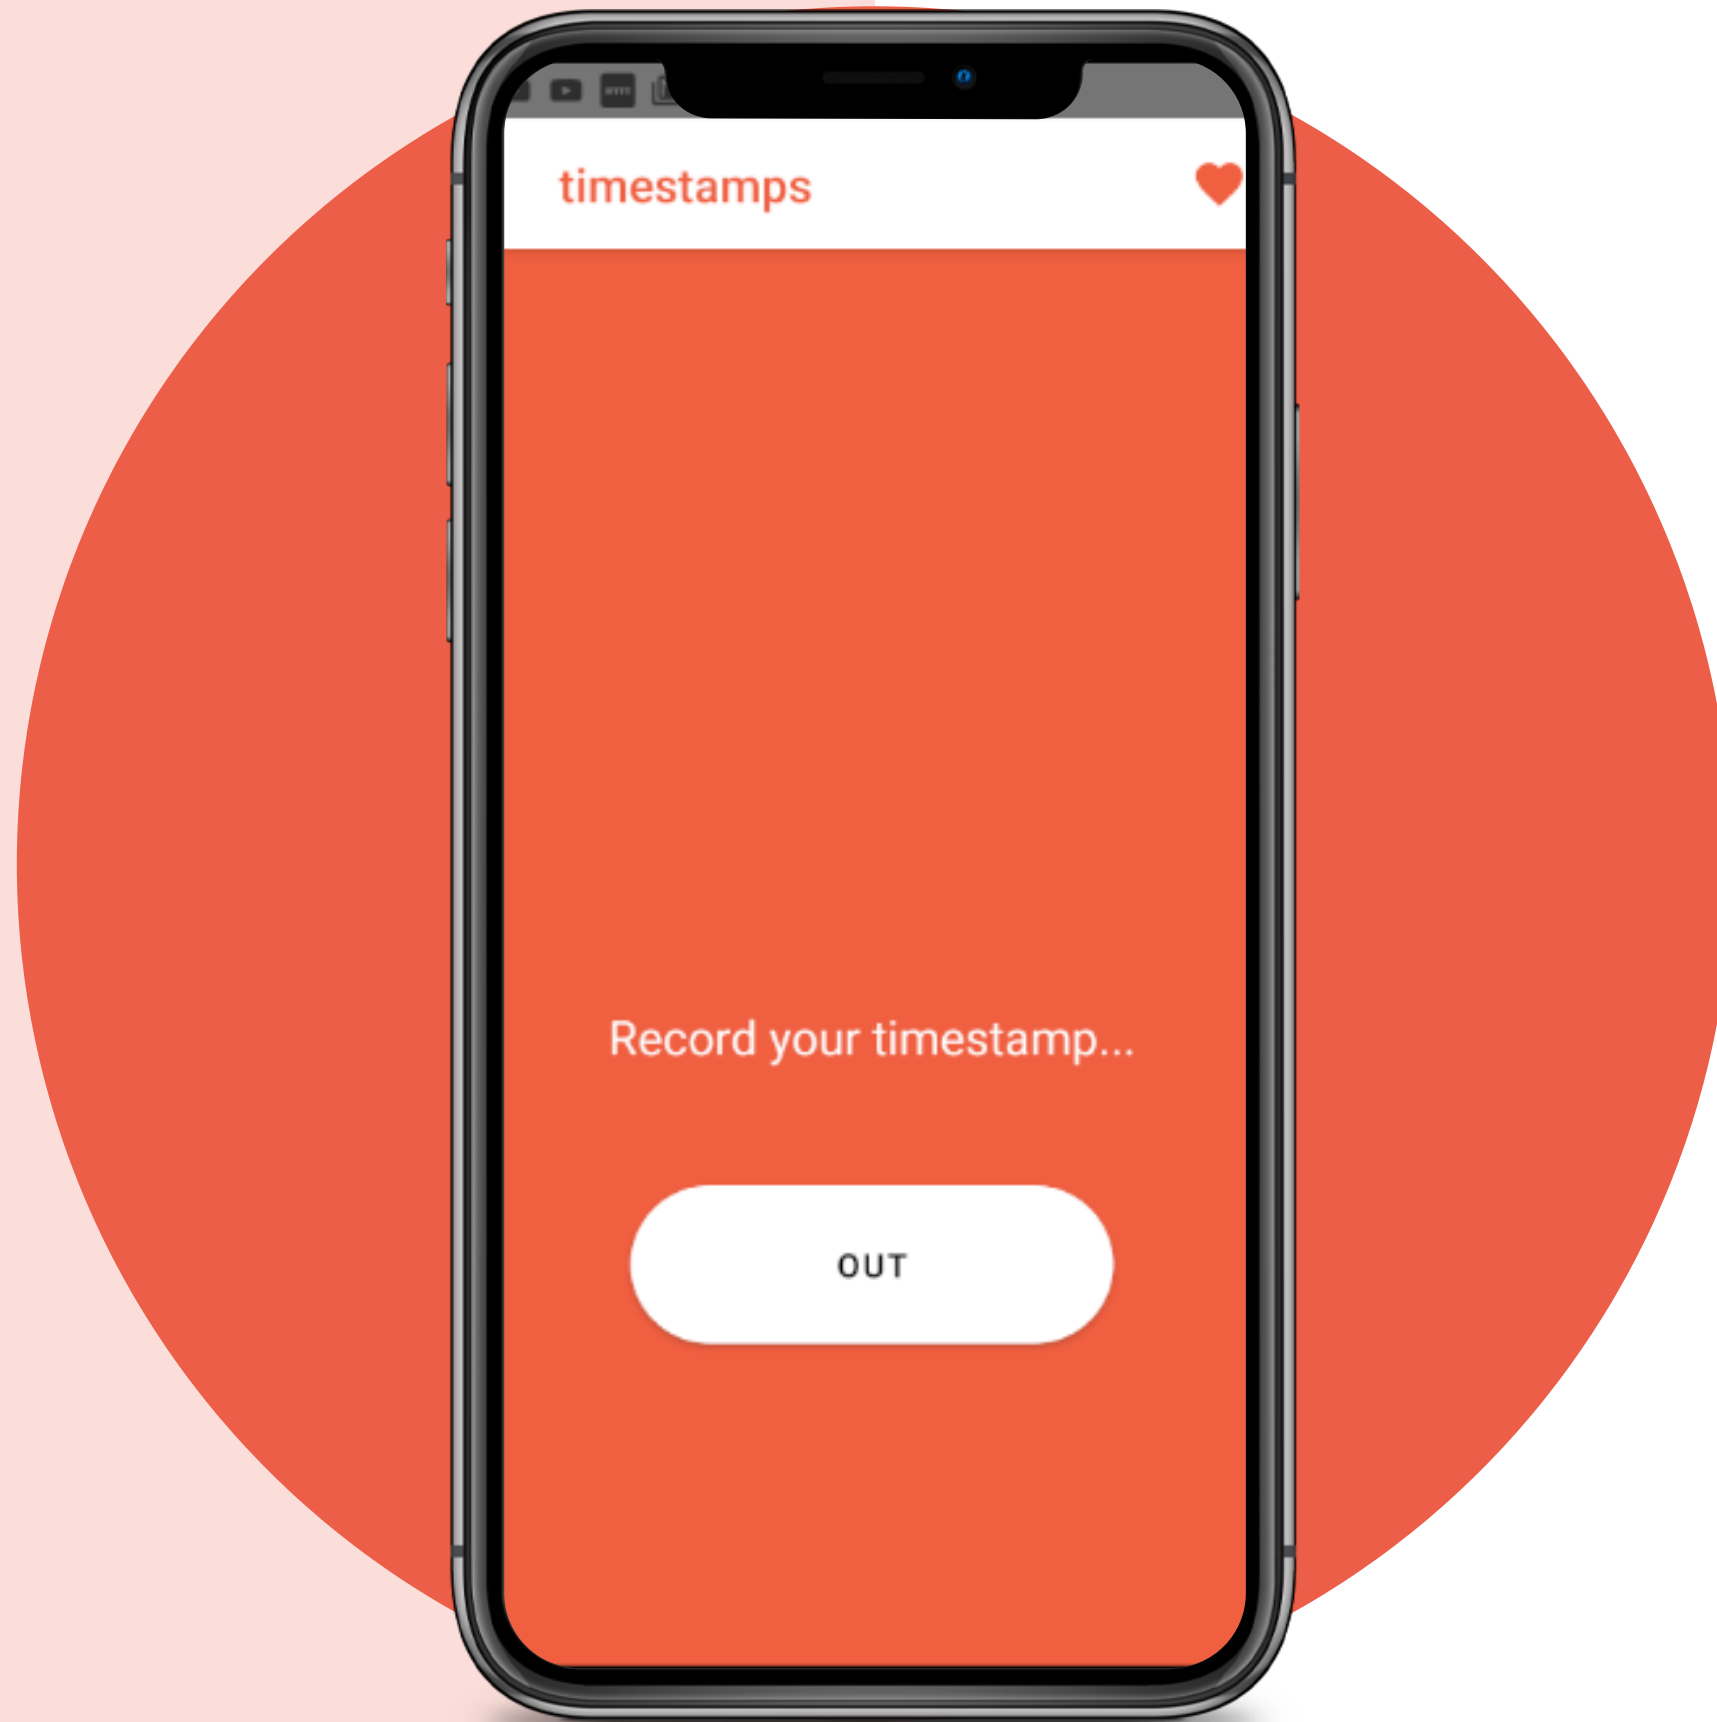

We didn't want to create dozens of screens in our app and add forms on each page.

The main idea behind creating this app was to create a simple UI and instead promote integrations.

WHY FOCUS ON INTEGRATIONS

Let's say your app designer did good work and you have a good working app.

But if your app is not integrating with other services and just relies on users to visit the app, it might not add good value to the market.

Let's quickly have an app
UI demo. We will cover
integrations after that

SUPPORTED INTEGRATIONS

01

Facebook Login

Your app really needs a good SSO and log-in mechanism.
Custom logins forms are old-school.

02

Firebase

Easy to work with.
Automatically creates REST interfaces to work with.

03

IFTTT(If this then that)

Every platform today is now available on IFTTT.

04

NFC

Let's user perform timestamping just by a touch of tag.

TAKE AWAY

If your product integrates well, it sells.

We have already taken a big step towards a microservice architecture. The next step needs to be integrations using these microservices.
